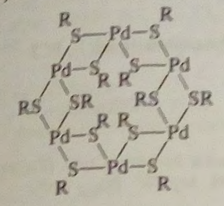
Bis(propanethiolato)palladium(*II*)

Palladium propylmercaptide



R = $CH_2CH_2CH_3$
hexamer

M 256.7
Hexameric; puckered ring struct. of bridging SR groups with approx. square planar Pd.

Hexamer: [35359-97-8]. *Dodecakis[μ-(1-propanethiolato)]hexapalladium*(II), *9CI*
$C_{36}H_{84}Pd_6S_{12}$ M 1540.3
Synth. from Tetrachloropalladate(*II*)(2−), IC-017115 and propanethiol. Pleochroic orange-yellow and yellow, or orange-red needles. Sol. $CHCl_3$, C_6H_6; spar. sol. EtOH, Me_2CO, pet. ether. Mp 209-210°.

M 166.1

Widely used organophosphorus reagent. Deoxygenates epoxides to alkenes, peroxides to ethers, hydroperoxides to alcohols, desulfurizes the analogous sulfur compds. Condensing agent with Py/Br_2 or Py/I_2 for synth. of esters and amides. Deoxygenates *tert*-amine *N*-oxides. Deoxygenates aryl nitro groups via nitrenes giving syntheses of heterocyclic compds. including phenazines, phenoxazines, phenothiazines, indazoles, triazoles and also azepines. Converts aromatic dicarbonyl compds. to epoxides. Carbonyl compds. may be reductively dimerised, e.g. phthalic anhydride → biphthalyl. Widely used in Arbuzov reactions for synth. of phosphonic and phosphinic di-Et-esters, for use in Wadsworth-Emmons reactions. Liq. with characteristic, obnoxious, phosphite odour. d_4^{20} 0.963. Bp_{16} 57-58°. n_D^{25} 1.4105.

M 211.0 (ion)

Synth. by treating $Mn(OAc)_2$ or $MnCO_3$ with excess aq. $CN^\ominus$ under rigorous exclusion of O_2. $t_{\frac{1}{2}}$ $CN^\ominus$ exchange *ca.* 5 min. at pH 11.8. Aq. solns. are yellow and readily lose $CN^\ominus$ unless excess $CN^\ominus$ concs. at 1.5*M* present. They contain several Mn spp. and dec., depositing green insol. products which appear to contain the ion $[Mn^{II}[Mn^{II}(CN)_6]]^{2\ominus}$. Low spin d^6 anion 10dq 30,000 cm^{-1}. $Mn(CN)_6^{3\ominus}/Mn(CN)_6^{4\ominus}$ couple 0.24V.

Tetra-Na salt, decahydrate: [33913-99-4].

$C_6K_4MnN_6$ M 367.4
Synth. by heating the trihydrate at 100° *in vacuo*. Grey-violet.

Tetra-K salt, trihydrate: [14323-52-5].
Synth. by action of excess KCN on $MnCO_3$. Blue-purple cryst. (aq. KCN >1.5*M*), oxygen sensitive, efflorescent. μ_{eff} = 2.18μ_B (300K). Blue colour suggests presence of some Mn^{III} or Mn^{IV} and electron transfer band. Dissolves in aq. KCN to give yellow solns.

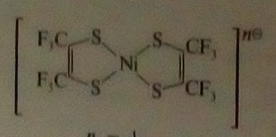
Bis[1,2-bis(trifluoromethyl)ethane-1,2-dithiolato]nickelate(1−)
Bis(1,1,1,4,4,4-hexafluoro-2-butene-2,3-dithiolato)nickelate(1−)
[16674-52-5]



$n = 1$

M 511.0 (ion)
Square planar. Formed from Bis[1,1,1,4,4,4-hexafluoro-2-butene-2,3-dithiolato(2−)-*S*,*S*′]nickel, IC-005880 + planar organic molecules giving stacked structure with one dimensional electrical conductance. Interesting magnetic properties. Ligand formerly known as thiete.
Phenothiazine salt: [53142-51-1].
$C_{20}H_9F_{12}NNiS_5$ M 710.2
Dark brown cryst. (C_6H_6/pentane). Sol. C_6H_6, CH_2Cl_2. Ferrimagnetic.
Tetrathiafulvalene salt: [54992-69-7]. *2-(1,3-dithiol-2-ylidene)-1,3-dithiol salt, 9CI*
Black needles (C_6H_6). Sol. C_6H_6, MeCN. Formulated as ionic struct. on basis of magnetic props. $\mu_{eff} = 1.7\mu_B$; departs from Curie-Weiss behaviour <35K.

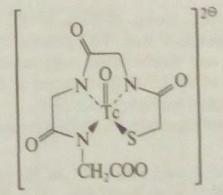
Mercaptoacetyltriglycine-Tc. *MAG*$_3$*-Tc*. *Tc-MAG*$_3$. *Tc-mertiatide*
[104318-29-8]



M 373.1 (ion)
This N_3S ligand gives a Tc complex analogous to the diaminodithiolato (N_2S_2) series, but without the latter's stereochemical complications. Several other mercaptotripeptide ligand-Tc complexes have been prepared, but none are yet of any importance. Synth. from $TcO_4^{\ominus}$ plus preformed ligand with dithionite reduction, or by ligand exchange from Tc gluconate complex. Renal imaging agent; no clear advantage over widely used Tc-DTPA; clinical preparations have limited shelf-life.

M 475.3 (ion)
Square-pyramidal anion; ligand in *meso-* or *rac*-form (or as dimethyl ester). There have been suggestions of *O,O' vice S,S'* coordination. It is often unclear whether Tc(*III*) (Tris[2,3-dimercaptobutanedioato(2−)-*O,O'*]technetate(3−), IC-007607) or Tc(*V*) complex is involved in pharmacol. applications, but this oxotechnate(*V*) form has recently been fully characterised. Synth. from $TcO(gluconate)_2$, or by Sn(*II*) or electrochem. reduction of $TcO_4^{\ominus}$ in presence of 2,3-dimercaptosuccinate. This and Tc(*III*) analogue Tris[2,3-dimercaptobutanedioato(2−)-*O,O'*]technetate(3−), IC-007607 are widely used imaging agents, especially for kidneys and for thyroid.

[21959-01-3]

$(THF)_2ZrCl_4$

M 377.2
Octahedral: config. not known. Synth. by adding THF to a soln. of $ZrCl_4$ in CH_2Cl_2. White, air-sensitive solid. Mp 170-171° dec.

▷ A violent reaction occurs if THF is added to anhydrous $ZrCl_4$.

C_8K

Potassium graphite (KC_8), 9Cl

Potassium compd. with graphite (1:8), 11Cl, 10Cl. Potassium-graphite intercalate. Potassium-graphite lamellar compound
[12081-88-8]

C_8K

M 135.1
Member of a series of compds ($C_{24}K$, $C_{36}K$, $C_{48}K$, $C_{60}K$, $C_{72}K$) formed by intercalation of potassium into the graphite layer lattice struct. Synth. either by reaction of K vapour with graphite at 300°, by electrolysis of fused K salts with graphite electrodes or by reaction of graphite with solns. of K in liq. NH_3. Becomes superconducting at 0.14K, forms intercalation compds. with H_2 (C_8KH_2) or C_8KD_2). Powerful reducing agent. Bronze powder with metallic appearance. Moisture-sensitive. Reacts with H_2O_2, leaching out potassium as KOH.

Aqua complex, monohydrate: Aqua[5′-cytidylato(2−)] cadmium monohydrate. 5′-Cytidylic acid, cadmium salt dihydrate
Orthorhombic needles (H_2O). Distorted sq. pyramidal Cd is coord. to N of cytidylato ligand, 3 O of different phosphate groups and O of H_2O.
Aqua complex, sesquihydrate: [67761-40-4]. *5′-Cytidylic acid, cadmium salt hydrate (2:2:5)*
Formed in presence of urea. Monoclinic needles (H_2O). Polymeric: Cd coord. to 4 O of 3 different phosphate groups, to 2 N of cytidylato ligands and to O of H_2O.

Prototype of many CoL_2X_2 compds. (L = pyridine or derivative, X = coordinating anion).

Monomeric-form [14024-92-1]

Tetrahedral struct. Obt. from polymeric form at 120° or by evaporation of $CHCl_3$ soln. Blue solid. Sol. $CHCl_3$, $MeNO_2$, $PhNO_2$.

Polymeric-form [26603-94-1]

Chain struct. with Cl-bridged octahedral CoN_2Cl_4 units. Synth. from $CoCl_2$ + Py. Formed from monomeric-form on standing in air. Violet solid. Sol. $CHCl_3$, $MeNO_2$, $PhNO_2$.
